Analysis, Modeling, Simulation and Experimentation

## Experimentation Estimating Toolkit

Karen Mourikas - AMSE Experimentation Denise Nelson - Phantom Works Affordability The Boeing Company

January 2008

## Agenda

- Overview of Experimentation
- Experimentation Estimating Approach
- Implementation of ACEIT Model
- Lessons Learned
- Next Steps
- Summary

Analysis, Modeling, Simulation and Experimentation

## Overview of Experimentation

## Experimentation Defined - Part I

## - Definition of Experiment *

- A test under controlled conditions that is made to
- demonstrate a known truth,
- examine the validity of a hypothesis, or
- determine the efficacy of something previously untried.
- Definition of Experimentation *
- The process of conducting such a test.
- Experimentation in general
- Consists of gathering and examining data
- Explores and Answers Questions with Analyses and Observations

## Types of Experimentation

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## - Three Main Types of Experiments

- Discovery (to understand effects of innovation)
- Effective Collaboration
- German Battlespace
- Hypotheses Testing (if $A$ then $B$ under conditions $C$ )
- Target Identification \& Tracking
- Information Sharing
- Technical Demonstrations (to showcase technology, concept, etc)
- Other Types of Experiments
- Wargames \& Exercises
- Seminars / Symposiums / Workshops

## Discovery Experiments

## Effective Collaboration

- Discovery Experiment analyzing the question "What makes for effective collaboration?"
- "how do differences in group structure, communications patterns, work processes, participant intelligence, participant cooperative experiences, and participant expertise affect the quality of collaboration?" *
* Code of Best Practice for Experimentation, Alberts, Hayes, et al., 2002

## Historical Discovery Experiments

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## Information / Communications CONOPS

- "Perhaps the most famous initial discovery experiments were those conducted by the Germans to explore the tactical use of short range radios before World War II. They mimicked a battlespace (using Volkswagens as tanks) in order to learn about the reliability of the radios and the best way to employ the new communications capabilities and information exchanges among the components of their force."

## Hypothesis Testing

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## Objective: Investigate camera-only capabilities for identification and tracking

- Does tracking software XX provide sufficient target recognition and cueing to be used without radars?
- Compare camera with tracking software versus camera without tracking software
- If tracking software used (A)
-then increased Target Recognition (B)
- without radars (C)

Proposition: "information sharing will improve group situation awareness in combat"

- IF information sharing occurs,
- THEN group situation awareness will increase
-WHEN the subjects are military professionals working in a warfighting context.

## Experimentation Defined - Part II

## -Experimentation

- Contains Variability
- Demo ~ Broadway Play
- Scripted event where outcome is always the same
- Experimentation ~ Baseball Game
- Outcome is never exactly the same
- Current tactics are adapted for future games in light of observed outcomes

## - Campaigns of Experimentation

- Campaigns of Analyses or Experiments needed to build body of knowledge
- Iterative Approach based on outcomes of previous experiments and analyses

## Campaigns of Experiments

## Command and Control for Stabilization Operations

- Such as ensure security, provide reconstruction and humanitarian assistance, act as peacekeepers and engage in military operations
- Series of experiments evaluating competing and alternative approaches
- Explore alternatives identifying strengths, weaknesses, limiting conditions and reduce potential approaches to most promising
- Analyze final candidates under more realistic environments and identify best-value approach
- Develop demonstration of best-value approach for specific operational environments
- Purpose of campaign is to convince user community selected approach is the better candidate and to provide venue for user community to critique and improve approach

Campaigns of Experimentation, Alberts, Hayes, et al., 2006

Analysis, Modeling, Simulation and Experimentation

## Experimentation Estimating Approach

## Why are we doing this?

## - Each experiment is unique

- Different objectives, tasks, scope, domains, maturity, models, operators, personnel, etc
- Standard method of estimating needed
- Define Experimentation cost drivers to be as minimally subjective as possible
- System complexity-
-defines number of various interactions between the systems and/or subsystems (or Platforms, SoSs etc)
-Experimentation Type: Constructive/Virtual/Live
- Leverage from previous efforts: re-design and new-design of work products
- Properly capture data from future efforts to better refine estimating relationships

## General Approach

## - Development Approach

- Establish generic WBS for Experimentation efforts
- Develop Interview Process and Collect Data
- Perform Statistical Analysis on Normalized data
- Generate Cost Estimating Relationships (CERs)
- Design and Implement estimating Model
- Next Phase: Collect and analyze future data points
- Record labor data to distinguish time spent on each project/event
- Collect information immediately at end of scheduled effort/phase
- Update/calibrate model with new data points throughout the year
- Train Project Leaders/Estimators on the estimating tools as a standard to validate (and generate) future estimates

## Establish Generic WBS

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

- Six general phases of Experimentation*
- Discovery (Customer Interaction)
- Understand customer needs and issues
- Problem Formulation
- Identify and Scope problem
- Experiment Design
- Decompose problem
- Experiment Development
- Build, Implement, Test \& Verify
- Experiment Execution
- Conduct the Experiment
- Analysis

- Analyze data and interpret results
* From Guide for Understanding and Implementing Defense Experimentation GUIDEx, 2006

## Representative Tasks in Each Phase

- Discovery (Customer Interaction)
- Understanding the needs of the customer and capability gaps
- Problem Formulation (Preliminary)
- Preliminary identification of problem
- High level Plan of Action
- Design (Refinement)
- Detailed design and planning of the experiment
- Refined Experimentation Objective / Propositions / CONOPS
- M\&S Requirements (tools, scenarios)
- Data, MOEs/MOPs, Analysis Planning
- Architecture Products
- Detailed Plans : Experimentation, Analysis, Communication and Training

## Representative Tasks in Each Phase

- Development (Implementation)
- Development \& Integration of Mod\&Sim Scenarios, Tools
- Analysis of Metrics to ensure Experiment Questions are answerable
- Training of Operators, Observers, \& other Participants
- Execution (Conduct)
- Conduct of the Experiment
- Data Collection
- Analysis (Assessment)
- Pre-Experiment Analysis Planning
- Metrics, Data Generation, Transmission, Reduction, Collection, Analysis
- Post-Experiment Reduction and analysis of the experiment data
- Interpretation and documentation of results

## Data Collection \& Interview Process

## - First Attempt

- Asked "How much did it cost?"
- Total and by phase, with schedule data
- Provided detailed tasks for assistance
- Result
- Too much variability in scope and type of effort
- No consistency in data or data format

## - Second Attempt

- Developed Interview Questionnaire to scope effort
- Start/Stop work for given interval of work
- Clearly defined questions and examples to guide the interviewee
- Result
- Consistent data format
- Better defined scope and definitions
- 22 completed Data Points plus 11 In-work efforts

## Questionnaire Ground Rules

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## - Data Point Defined Scope

- Schedule Start/Stop to distinguish "follow-on work" start times
- Actuals/Budget of identified time interval
- Actuals/Budgets/Tools/Personnel questions only refer to the primary work group under the supervision and control of the project lead (unless otherwise noted)
- Data not captured
- Standard/indirect cost that would be spent regardless of the effort in question
- Software licenses/maintenance
- Hardware and facility upgrades
- Training

## Questionnaire Focus

- Experiment/System Complexity
- Number of interacting Classes/
- Constructive, Virtual, Live
- Tools/Models/Simulations
- Existing, Integrate As-is
- Existing Modified
- Newly Developed
- Leverage from previous work
- Number of MOEs/MOPs
- Delivered/Calculated
- Customer Involvement
- Integration
- Actuals/Budget \$K
- Actual/Scheduled Months
- Man Months (EP)
- Developers/System Engineers and Designers
- SME and PM
- Other Costs
- HW/SW tools and licensing*
- Training* and Travel
- Security Level
- Special notes of interest
*Costs above and beyond team's
expected annual expenditures

## Data Analysis

- Minor trends and correlations noticed
- but no "statistical significance" calculated
- Percent breakouts for PM/SME/etc. look promising
- Possible data nuances:
- Project actuals (\$K , schedule, EP) vs. estimates
- Regression on Qualitative Data

- Subjective data
- Limited data
- Cost driver assumptions
- Refinement of questions for future data collection is required

Analysis, Modeling, Simulation and Experimentation

## Implementation of ACEIT Model

## Model Design and Development

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## - Evaluated various tools

- Excel Based Customized Tools
- Need to be developed
- DesignSheet Tool
- Not user friendly
- Needs to be developed

## - ACEIT Selected

- Versatility to add/reconfigure body of model
- Post Reports
- Automated reports
- Drill down Capability in Reports
- Excel to ACEIT Capability
- Input and extracting data in model
- Possible GUI interface
- Risk Capabilities
- Inflation/Learning

## Model Inputs

- Experiment Complexity
- System Complexity (Approximate number of different types of interactions)
- Experiment Type (Constructive Virtual Live)
- Phase/Concept Maturity
- Design Complexity
- Reuse/Redesign/Leverage from previous work
- Integration Complexity
- Number of different tools used
- Number of sites
- Security
- Other Drivers TBD

## Experiment Complexity - Determines Analog Data

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

| Experiment Complexity <br> Concept/ <br> Product <br> Maturity |

$$

## Design Complexity Look-up Function

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## Model Outputs

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

## - Cost

- EP hours
- Developers/SE
- PM
- SME
- SW/HW, Training and Travel
- \% cost for CVL
- Expected Schedule (months)
- Schedule Scrunched/Expanded costs
- Risk Assessment
- Experiment Event Metrics
- EP to run experiment (body count)
- Days
- GUI interfaces

## Q BTEENE

Analysis, Modeling, Simulation and Experimentation

## Lessons Learned

## Lessons Learned

Advanced Systems | Analysis, Modeling, Simulation and Experimentation

- Different Languages
- COBP-X/GuideX/Boeing
- Tool/Model/Simulation
- Processes
- Phases
- Different Opinions
- Naysayers
- Enthusiasts

## Q BTEEINE

Analysis, Modeling, Simulation and Experimentation

## Next Steps

## Next Steps

- Refine time charging to better capture future efforts
- Resonate the modeling inputs and techniques to project leaders and estimators
- Use model to plan projects initially
- Collect data at end of projects
- Refine/verify collected data and assumptions
- Continue to collect data
- Calibrate/refine Model with new data
- Mature and refine model in conjunction with SMEs to better represent and define cost drivers and level of detail

# Analysis, Modeling, Simulation and Experimentation 

## Summary

## Summary

- Experimentation
- Helps to assess concepts and technologies, causes and effects, and/or conclusions
- Explores and Answers Questions with Analyses and Observations
- Is not a scripted Demo
- Developed standard method of cost estimation
- Each experiment unique
- Experimentation WBS separated into six phases
- Data Collection and Comprehension the biggest task
- Implemented Model in ACEIT
- Biggest Lesson Learned : Need for common language
- Next Steps : Refine and Mature Model and Data Collection/Analysis
